NetDelivery

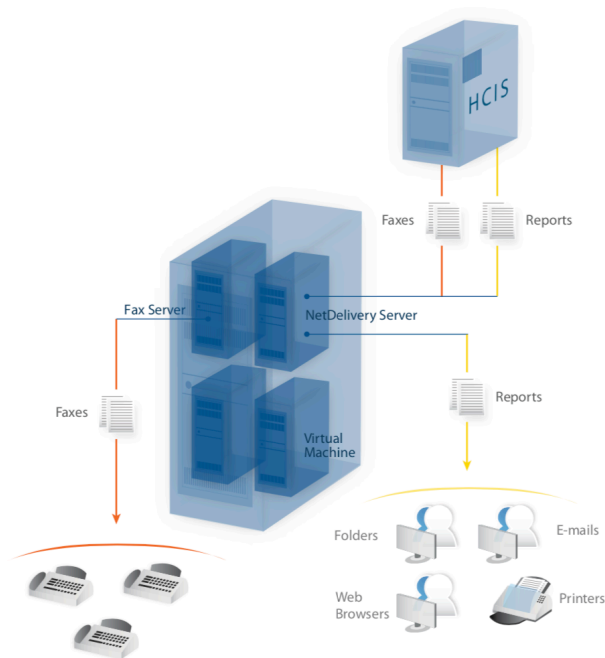

Your Care Team Informed™

Virtualized Intelligent and automated distribution of patient information

REDUCE COSTS AND SIMPLIFY MANAGEMENT WITH A COMPLETELY VIRTUALIZED INFORMATION DISTRIBUTION SOLUTION

Healthcare providers require the ability to retrieve patient information and reports in a highly secure environment. NetDelivery report distribution solutions from Interbit Data enables hospitals and providers to simply and securely send patient information generated from your Healthcare Information System (HCIS). This information can be sent in the format most beneficial to the end users, including fax, print stream, encrypted file, or e-mail.

Now NetDelivery is available in a completely virtualized solution (including fax modems) that complies with HIPAA requirements for patient data security. Virtualization of information distribution is a powerful solution that allows you to both reduce costs and simplify management – two critical goals for healthcare organizations that are dealing with increasing patient loads and government regulations.

VIRTUALIZED NETDELIVERY REDUCES COSTS

Virtualizing NetDelivery increases server utilization, reduces software and hardware costs, and gives you a smaller data center footprint without sacrificing scalability.

With virtualized fax servers, you can run workstations and servers that have different operating systems on the same fax server at the same time. Thus, fewer fax servers are needed to get the same fax

capacity, saving you money on hardware. NetDelivery's virtualized report delivery servers reduce your costs even more by giving you efficient, flexible, high-volume report delivery without having to implement or maintain physical servers. This delivers big savings on infrastructure and energy costs, and allows you to maintain a smaller data center footprint.

VIRTUALIZED NETDELIVERY SIMPLIFIES MANAGEMENT

For healthcare organizations to deliver patient reports to clinicians within and outside of your facility, the NetDelivery virtualized solution provides simplified deployment that enables centralized management of resources. Virtualization also allows for better management of fax server resources and reduces points of breakage, resulting in a more reliable and simpler-to-manage solution.

BENEFITS AT-A-GLANCE

- Consolidates your network to lower total equipment, maintenance, and operating costs
- Reduces long-distance costs and eliminates the need to maintain fax ports on your PBX system
- Provides simplified and centralized management of fax resources and simplifies fax server deployment
- Increases server utilization, delivering a smaller data center footprint with no reduction in scalability
- Leverages virtualization to provide business continuity and to simplify disaster recovery
- Supports software-enabled Fax-Over-IP and virtualization without an existing Voice-Over-IP network
- Complies with HIPAA requirements for securing and transmitting patient information
